HIV prevalence in Kenya is high, with an estimated 1.2 million people living with HIV. Client characteristics: Currently, guidelines are being developed to improve the provision of HIV self-testing (HST) in Kenya. 323 (82%) of the clients were identified as female, while 422 (89%) were married. Counseling before provision of the HIV self-test was an essential part of the service. 1,217 (86%) of the clients were provided with counseling, while 1,410 (99%) were provided with instructional materials. The FGDs were held only for the study group, and 77% were Protestants. Open Data Kit (ODK) software was used to collect data electronically. Data were uploaded weekly and regularly monitored for errors. 1,410 ANC clients were recruited into the study: 72% were between the ages of 18 and 34; the median age was 25 years. 87% were married, 11% were cohabitating, and 2% were single. 87% reported they were ever tested for HIV. In the KAIS 2012 report, 71% of Kenyans reported they had ever been tested for HIV. In the current study, 77% were Protestants, which is lower than the national average of 85%. The site selection was based on the number of ANC clients attending the clinics. Client was identified by the service provider and their partner. Client was also counseled on how to handle the self-test kit. Client was provided with instructional materials and two self-test kits. Clients were given their specific invitation cards to take to their partner. The self-test's ease of use, convenience/time saved, and privacy/confidentiality were the main reasons for choosing the self-test. 1,107 (78%) of the clients were female, 1,133 (77%) were married, and 1,115 (87%) were living together during the study. 56% had at most a primary level of education. 93% reported they were ever tested for HIV and 87% reported they were ever tested for HIV and 93% reported they were ever tested for HIV. Men's Self-Reported HIV Testing (2014). 7% were married, 11% were cohabitating, and 2% were single. 87% reported they were ever tested for HIV and 93% reported they were ever tested for HIV. The study recruited women who were attending ANCs and their partners. 387 (83%) of the women were married, 11% were cohabitating, and 2% were single. 56% had at most a primary level of education. 93% reported they were ever tested for HIV and 87% reported they were ever tested for HIV. The study recruited women who were attending ANCs and their partners. 387 (83%) of the women were married, 11% were cohabitating, and 2% were single. 56% had at most a primary level of education. 93% reported they were ever tested for HIV and 87% reported they were ever tested for HIV. The study recruited women who were attending ANCs and their partners. 387 (83%) of the women were married, 11% were cohabitating, and 2% were single. 56% had at most a primary level of education. 93% reported they were ever tested for HIV and 87% reported they were ever tested for HIV.
